INTRODUCTION

The Wellmeadows Hospital Management System is a web-based hospital information system developed to improve the management and day-to-day operations of Wellmeadows Hospital, a healthcare institution located in Edinburgh that specializes in caring for elderly patients. The system was based on the Wellmeadows Hospital case study, which describes the different hospital processes involving staff management, patient records, ward allocations, appointments, medication monitoring, requisitions, and reporting.

The application was designed to digitize and centralize hospital operations that were traditionally managed using paper-based forms and manual record keeping. Through the system, hospital personnel can efficiently create, update, search, and monitor hospital records in real time. The system also improves data accuracy, accessibility, and organization while reducing redundancy and manual processing errors.

The system supports five major hospital roles, namely the Personnel Officer, Medical Director, Clinical Staff, Nurses, and Cashier. Each role is provided with specific modules and functions based on their responsibilities inside the hospital. The Personnel Officer manages staff records, qualifications, work experiences, contracts, and staff ward allocations. The Medical Director oversees hospital resources, reports, suppliers, and overall hospital operations. Clinical Staff and Nurses handle patient monitoring, ward management, appointments, medication records, and treatment-related processes. Meanwhile, the Cashier manages payment-related transactions and financial records connected to patient services.

The system was developed using Laravel as the web framework and PostgreSQL as the database management system. Database functions, procedures, and triggers were implemented to automate important operations such as updating staff records, managing ward allocations, preventing duplicate entries, and maintaining data consistency between the PostgreSQL database and the web application interface.

OBJECTIVES

General Objective

The main objective of the Wellmeadows Hospital Management System is to develop a centralized and efficient web-based hospital information system that will help manage the daily operations of Wellmeadows Hospital, improve record management, automate hospital processes, and provide accurate and organized access to hospital data for authorized users.

Specific Objectives

- To develop a secure login system with role-based access for different hospital personnel such as Medical Director, Personnel Officer, Clinical Staff, Nurses, and Cashier.
- To create and maintain staff records including personal information, qualifications, work experiences, contracts, and staff allocations.
- To manage ward and bed allocations efficiently for both patients and hospital staff.
- To record and monitor patient information, appointments, admissions, and discharge details.
- To manage patient medication records including prescribed drugs, dosage, administration method, and treatment schedules.
- To maintain and monitor hospital supplies, pharmaceutical inventories, and requisition records.
- To generate reports such as staff allocation reports, qualification summaries, patient reports, and ward monitoring reports for hospital management and decision-making.
- To implement PostgreSQL database functions, procedures, and triggers in order to automate operations, prevent duplicate records, and maintain data consistency between the database and the web application.
- To provide faster, more organized, and more reliable access to hospital information compared to manual paper-based record systems.

SCOPE AND LIMITATIONS

Scope of the System

The Wellmeadows Hospital Management System is a web-based platform created to help organize and simplify the hospital's daily activities and record management. The application supports different hospital departments by providing computerized processes for handling staff information, patient records, ward assignments, medications, supplies, and report generation.

The system allows authorized users such as the Medical Director, Personnel Officer, Clinical Staff, Nurses, and Cashier to access modules related to their responsibilities within the hospital.

The application includes the following capabilities:

- 1) Secure account login with role-based access for different hospital personnel.
- 2) Management of employee information including:
 - a. personal details
 - b. contact information
 - c. qualifications
 - d. previous work experiences
 - e. employment contracts
 - f. weekly staff assignments
- 3) Monitoring and management of patient records such as:
 - a. registration details
 - b. appointments
 - c. admissions
 - d. ward placement
 - e. discharge information
- 4) Allocation of staff and patients to wards and available beds.
- 5) Recording and tracking of patient medications, dosage schedules, and methods of administration.

- 6) Inventory handling for surgical, pharmaceutical, and non-surgical supplies together with requisition requests.
- 7) Generation of hospital reports for staffing, ward assignments, qualifications, work experiences, patient monitoring, and supply usage.
- 8) Use of PostgreSQL database functions, procedures, and triggers to automate operations, minimize duplicate entries, and maintain accurate records.
- 9) Real-time synchronization between the Laravel web application and the PostgreSQL database to ensure updated information is reflected immediately in the system.

Limitations of the System

Although the application provides several useful hospital management features, there are still limitations present in the current version of the system.

1. The project was developed based on the Wellmeadows Hospital case study and may require additional customization for actual hospital deployment.
2. The system is primarily accessed through a web browser using a localhost environment, while mobile accessibility is currently limited to the Flutter-based application and is not yet fully implemented as a standalone mobile platform.
3. Financial transactions are limited and do not support direct online payment gateways or banking integrations.
4. Report generation is only limited to the available built-in reports designed in the application.
5. The application focuses only on the modules required in the case study and does not fully cover every operation performed in large-scale hospitals.
6. Since the project was developed for academic purposes, further testing, optimization, and enhancements may still be necessary for real-world implementation.

TARGET USERS

The Wellmeadows Hospital Management System is designed for authorized hospital personnel responsible for managing and overseeing different hospital operations. The system provides role-based access to ensure that each user can only access the modules and functions related to their responsibilities within the hospital environment.

The intended users of the system are the following:

1. **Medical Director** — Responsible for supervising overall hospital operations, monitoring hospital resources, reviewing reports, and overseeing staff and ward management activities.
2. **Personnel Officer** — Handles staff-related records including employee information, qualifications, work experiences, contracts, and ward allocations. The Personnel Officer also generates staffing and allocation reports.
3. **Clinical Staff** — Responsible for managing patient-related information, appointments, treatments, and clinical records needed during patient care and consultations.
4. **Nurses** — Assigned to monitor patients, manage ward activities, record medication details, update patient statuses, and assist in daily healthcare operations.
5. **Cashier** — Handles financial-related processes including payment monitoring, billing-related records, and transaction management connected to hospital services.

The system is intended to be used within the hospital setting through a web browser connected to the hospital's local server or network environment. It is designed to help hospital staff perform their tasks more efficiently by providing faster access to records, organized data management, and automated hospital processes.

TOOLS AND TECHNOLOGIES USED

The system was developed using several modern web development tools, frameworks, and database technologies to ensure efficient performance, organized data handling, and a user-friendly interface.

1. **HTML (HyperText Markup Language)**

Used to create the structure and content of the web pages such as forms, tables, dashboards, and reports displayed in the system.

2. **CSS (Cascading Style Sheets)**

Used to design and style the user interface, including layouts, colors, tables, buttons, navigation bars, and responsive page elements to improve the visual appearance of the system.

3. **JavaScript**

Used to add interactivity and dynamic behavior within the application such as modal forms, search functionality, alerts, validations, and user interface interactions.

4. **Laravel Framework**

Laravel was used as the main PHP web framework for developing the system. It handled routing, controllers, authentication, database operations, validation, and backend logic of the application.

5. **PHP**

Served as the server-side scripting language used together with Laravel to process requests, manage business logic, and connect the application to the database.

6. **PostgreSQL**

Used as the primary relational database management system for storing and managing hospital records such as staff details, patient information, ward allocations, qualifications, and reports.

7. **pgAdmin4**

Used as the database administration and management tool for PostgreSQL. It was utilized to create tables, execute SQL queries, manage migrations, test functions, procedures, and triggers, and monitor database records.

8. **Functions, Procedures, and Triggers (PL/pgSQL)**

PostgreSQL procedural language features were implemented to automate database operations, prevent duplicate records, update timestamps automatically, and improve data consistency between the database and the web application.

9. Laravel Migrations and Seeders

Used to create and manage database tables and populate the system with initial sample data for testing and development purposes.

10. Flutter

Used for the partial mobile application integration of the system. The Flutter application communicates with Laravel through API integration for mobile accessibility features.

11. Visual Studio Code (VS Code)

Used as the primary code editor for developing and managing the source code of the application.

12. Git and GitHub

Used for version control, collaboration, and source code management among group members during system development.

SYSTEM FEATURES

The system is composed of five major modules designed to support the daily operations and management processes of the hospital. The first module is the **Patient Management Module**, which focuses on registering and updating patient information, maintaining medical records, assigning patients to wards and beds, and monitoring patient admissions and discharge details.

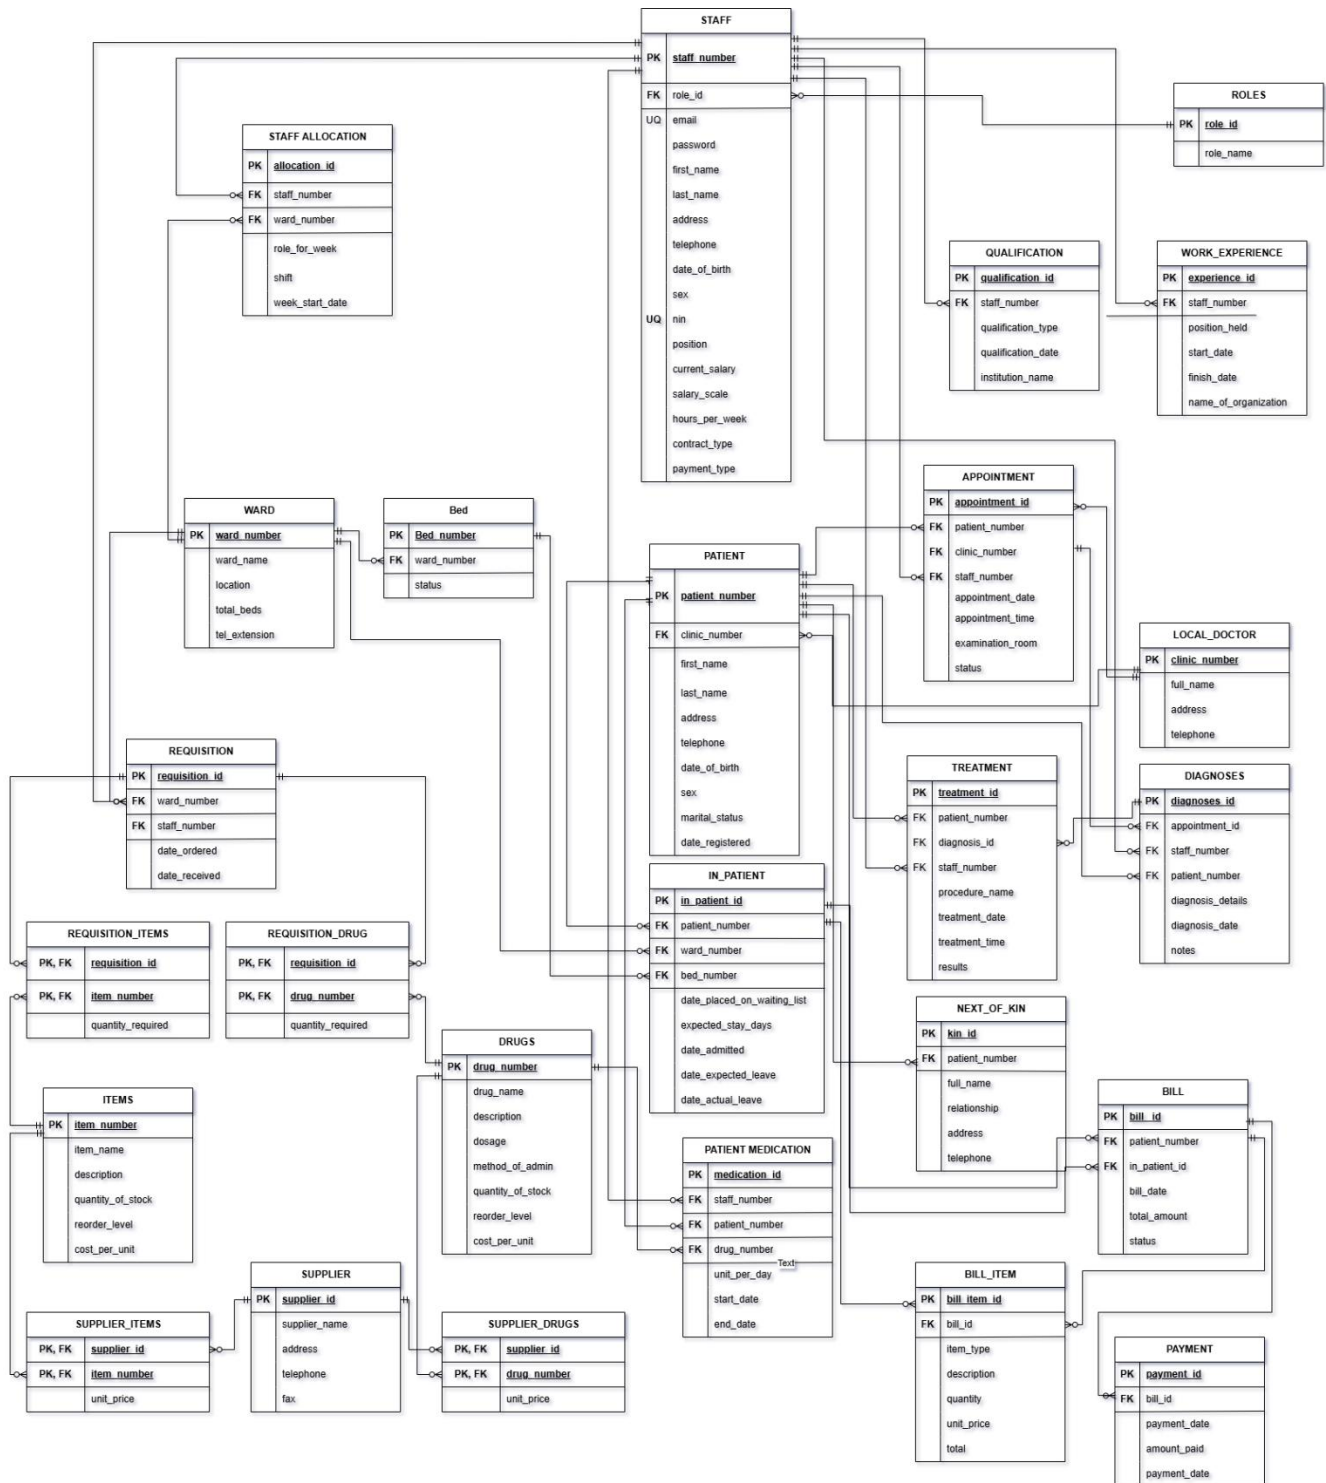

The second module is the **Staff and Department Management Module**, which handles the management of hospital personnel including doctors, nurses, and administrative staff. This module is responsible for maintaining staff records, assigning personnel to departments and wards, managing staff schedules and responsibilities, and organizing work assignments within the hospital. It also includes features for qualifications, work experiences, staff allocations, and personnel reporting.

The third module is the **Ward and Bed Management Module**, which manages hospital wards and bed allocation processes. This module maintains ward information such as ward names, types, and capacities while also monitoring bed availability and occupancy. It allows the hospital to assign beds to admitted patients and helps staff track vacant and occupied beds in real time to improve patient accommodation management.

The fourth module is the **Appointment and Treatment Module**, which manages patient appointments, treatment records, diagnoses, and medical procedures. Through this module, hospital staff can schedule appointments with doctors, assign healthcare professionals to treatments, and maintain treatment histories of patients. This module helps improve coordination between doctors, nurses, and patients while ensuring proper scheduling and monitoring of treatments.

The fifth module is the **Billing and Reporting Module**, which focuses on handling hospital billing, payment tracking, and report generation. This module generates patient bills for rooms, treatments, and medical services while also monitoring outstanding balances and payment transactions. In addition, it produces various reports such as patient records, occupancy rates, revenue summaries, and management reports that assist hospital administrators in decision-making and overall hospital monitoring.

DATABASE DESIGN

SYSTEM SCREENSHOTS

Module 1

a) Charge Nurse

The first screenshot shows the 'WellMeadows Hospital' dashboard for a Charge Nurse, Hayley Marshall. The dashboard includes a sidebar with navigation options: Dashboard, Ward Management, Medication, Patient Care, Staff Shift Management, Supplies, and Reports. The main content area displays a welcome message and four key metrics: Today Admissions (1), Active Patients (5), Available Beds (235), and Medication Orders (4). The date is Wednesday, 27 May 2026.

The second screenshot shows the 'Assign Beds' interface. It features a sidebar with navigation options: Dashboard, Ward Management, Assign Beds, Admit Patients, Discharge Patients, Ward & Bed, Ward Occupancy, Medication, Patient Care, Staff Shift Management, Supplies, and Reports. The main content area is titled 'Assign Beds' and contains two panels. The 'Ward Beds' panel lists six wards with their respective bed numbers: Cardiology Ward (17-27), Chronic Care Ward (226-234), Dementia Care Ward (137-145), Dialysis Ward (167-175), Emergency (65-75), and Endocrinology Ward (211-219). The 'Assign Patient to Bed' panel includes dropdown menus for Patient ID, Select Ward, and Select Bed, a date field for Date Placed in Ward (05/27/2026), and an 'Assign Bed' button.

SOURCE CODDE EXPLANATION

The system was developed using Laravel, where the source code is organized into routes, controllers, models, views, scripts, migrations, and seeders. Each part of the code has a specific responsibility in handling the system's functions and connecting the user interface to the database.

The **routes** are defined in `web.php` and are responsible for directing user requests to the correct controller methods. These routes allow users to access different pages such as the dashboard, staff management, patient records, ward and bed management, appointments, billing, reports, and login pages. They also handle form submissions for adding, updating, and deleting records.

The **controllers** contain the main logic of the system. They process user requests, validate input data, retrieve records from the database, and return the appropriate views. For example, the Staff Controller handles staff records, qualifications, work experiences, staff allocations, and personnel reports. Other controllers manage patient information, appointments, treatments, billing, payments, ward records, and role-based dashboards.

The **models** represent the database tables used in the application. These models allow Laravel to interact with tables such as staff, patients, wards, beds, appointments, bills, payments, qualifications, work experiences, and staff allocations. They help organize database operations and make it easier to retrieve, insert, update, and delete records.

The **views** are the Blade templates found inside the `resources/views` folder. These files display the user interface of the system, including dashboards, tables, forms, buttons, modals, and reports. Each role has specific pages depending on their assigned module, such as Personnel Officer pages for staff records and allocations, Medical Director pages for hospital monitoring, Nurse pages for ward-related tasks, Clinical Staff pages for appointments and treatments, and Cashier pages for billing and payments.

The **scripts** are JavaScript files used to improve user interaction within the system. They handle features such as search filters, modal pop-ups, form interactions, table filtering, alerts, and dynamic page behavior. These scripts make the system more responsive and easier to use.

The **CSS files** define the visual design of the system. They control the layout, colors, spacing, buttons, tables, sidebars, cards, and responsive styling. Separate stylesheets were created for different modules to maintain a clean and organized interface.

The **migrations** are used to create and update the database structure. They define the tables, fields, relationships, and constraints needed by the system. PostgreSQL functions, procedures, and triggers are also included in migrations to automate database operations and maintain data consistency.

The **seeders** provide sample data for testing and demonstration. They insert initial records such as staff members, qualifications, work experiences, ward allocations, patients, bills, and other hospital-related information. This allows the system to be tested immediately after migration.

Overall, the source code follows the Laravel MVC structure, where routes receive requests, controllers process logic, models communicate with the database, and views display the final output to the user. This organization makes the system easier to maintain, update, and understand.

TESTING SUMMARY

The Wellmeadows Hospital Management System was tested to ensure that the major modules and features functioned properly. Different user accounts for the Medical Director, Personnel Officer, Clinical Staff, Nurses, and Cashier were used to verify role-based access and dashboard navigation.

Sample data such as staff information, qualifications, work experiences, patient records, appointments, ward assignments, and billing details were entered into the system. The results showed that records were successfully added, updated, deleted, and displayed correctly in both the Laravel web application and PostgreSQL database.

Functions, procedures, and triggers were also tested in pgAdmin using SQL queries and updates. The testing confirmed that database operations and automated processes worked as expected. Some issues such as duplicate records and GitHub merge conflicts were encountered during development, but these were resolved through debugging, migrations, and restoring system files.

CHALLENGES ENCOUNTERED

During the development of the Wellmeadows Hospital Management System, several challenges were encountered involving database integration, UI conflicts, and synchronization of files among group members. One of the main problems experienced was duplicate records when adding qualifications, work experiences, and staff allocations. This issue was resolved by implementing PostgreSQL procedures and Laravel update logic to automatically update existing records instead of creating duplicates.

Another challenge involved missing PostgreSQL functions and migration conflicts after pulling updates from GitHub. Some modules produced errors because certain database functions did not exist locally. This was addressed by running migrations again, restoring missing database routines, and synchronizing the database structure with the latest project version.

The group also encountered UI and layout conflicts after merging and pulling commits from different members. Some pages were overwritten by other module layouts, causing incorrect dashboards and sidebars to appear. This problem was solved by restoring specific files from previous working commits and managing changes using separate Git branches.

Additional challenges included route errors, controller method conflicts, and maintaining consistency between the Laravel web application and PostgreSQL database. These issues were resolved through debugging, testing, cache clearing, and continuous collaboration among group members.

CONCLUSIONS AND RECOMMENDATIONS

The system was successfully developed to help manage and organize the hospital's daily operations through a centralized web-based platform. The system was able to support important hospital processes such as staff management, patient records, ward allocation, appointments, billing, and report generation. By integrating Laravel and PostgreSQL, the application provided organized data handling, automated database operations, and real-time synchronization between the web interface and the database.

The project also demonstrated the use of PostgreSQL functions, procedures, and triggers to improve data consistency, reduce duplicate records, and automate system processes. Overall, the system improved accessibility, organization, and efficiency compared to manual record-keeping methods.

For future improvements, the system may include a fully developed mobile application, stronger security features, cloud-based deployment, backup recovery systems, and additional hospital modules such as laboratory and pharmacy management. Enhancing the user interface and expanding report generation features may also improve the overall usability and functionality of the system.
